

Assignment 1

Overlapping photographs

Program considerations:

- Rectangles are either partially overlapping or inside one another, no other cases are allowed, that is no two rectangles share a common side
- Input data – bottom left-hand coordinate, $(x1, y1)$ and top right-hand coordinate, $(x2, y2)$ are provided in that order

Suggested algorithm design:

Consider each side of each rectangle:

Consider each line segment of each side:

If the line segment is NOT inside any other rectangle, then 'on boundary' is true.

If 'on boundary' is True, then add one to the total perimeter.
